The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/dentification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter
                                                                                                                                                                                                                                       Sequence 1647
                                                                                                                                                                                                                                                                                           genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-FEB-2002; 2002WO-IB003040

                                                                                                                                                                                                                                                                                                                                                        The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;

                                                                                                                                                                                                                                                                                                                                                                                           The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #11 from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic CC polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, station in the control of the proteins and endophthalmitis. CC pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory Clasions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a CC sample with a binding agent that binds to the proteins of the invention can determining the amount of bound protein in the sample. The CC specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and CC downregulate expression and activity of P. acnes polypeptides and CC diagnostic agents for determining P. acnes presence, for example, by can appear to the printed specification, but was contained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc encoding a Propionibacterium acnes protein. The invention also relates to golypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to climmunogenic fragments of P. acnes polypeptides. The invention also relates to compression vectors and host cells comprising a dimutospition proteins of proteins ratioodies against polypeptides of the invention; comprising a polypeptide of the invention; antibodies against polypeptides of the invention; a method for stimulating an immune response specific for a P. acnes complypeptide and an isolated T cell population comprising P. acnes polypeptides, polypucleotides, antibodies, fusion proteins, T cell populations, or comparison of electring or determining the presence or absence of P. acnes in a comparison of electring or determining the presence or absence of P. acnes in a comparison. The P. acnes polypeptides, polypucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides, antibodies, fusion proteins. The P. acnes polypeptides, polypucleotides, antibodies, fusion proteins. The polypucleotides can also be used as probes or primers for culgivis, or for stimulating an immune response specific for a P. acnes composition is useful for the primated specific action, but was obtained in electronic format directly from protein. The present of the print of the prin
                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

CC sequence of a Blidobacterium genome selected from the nucleotide comparison of a Blidobacterium genome selected from the nucleotide cC least 90% identity or which hybridises with the sequence given in CC least 90% identity or which hybridises with the sequence given in CC ABQ81842 and ABQ81843. Also described is a polypucleotide (II) encoding a CC in ABP65258 to ABP66354 ligated in frame to a polypucleotide encoding a CC activities, and can be used as an inhibitor of Salmonella. (I) (which is C aprobe) is useful for the detection and/or identification of Salmonella. (I) (which is C aprobe) is useful for the detection and/or identification of Salmonella. (I) (which is C aprobe) is useful for the detection and/or identification of Salmonella. (I) (which is C aprobe) is useful for the detection and/or identification of Salmonella. (I) (which is C aprobe) is useful for the detection and/or identification of Salmonella. (I) (which is C aprobe) is useful for the detection and/or identification of Salmonella. (I) (which is C aprobe) is useful for the detection and/or identification of Salmonella. (I) (which is C aprobe) is useful for the sex fermented milks, milk based fermented C products, ide-creams, fermented ceral based products, milk based fermented C products, infant formula, pet food or a pharmaceutical composition C selected from tablets, liquid bacterial suspensions, dried oral corposition of the Bitidobacterium gene. ABQ81850 represent C expression of the Bitidobacterium gene. ABQ81850 represent C I isting from the present invention but not mentioned further within the Sequence C in the printed specification but is based on sequence information C in the printed specification but is based on sequence information
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 3; SEQ ID NO 809; 80pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL130511), expressed DNA sequences (ABL16176-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventive seful in developmental biology and in elucidating cell signaling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a cit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound that regulates the activity of one or more of the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a The invention discloses a composition comprising two or more or human polynucleotides or a polynucleotide which represents derivative or allelic variation of the nucleic acid sequence. or more isolated rat Also fragment,

The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fig. wipo.int/pub/published_pct_sequences.
                                                                                                                                               Claim 1; Page 91; 126pp; English.
                                                                                                                                                                                          Novel polypeptide of somatic protein extract useful as vaccine against virulent Mycobacterium infection, isolated from cell wall, cell membra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tuberculosis; TB; antigen; vaccine; diagnosis; somatic; tuberculostatic; infection; interferon-gamma; IFN-gamma; protective immunity; therapy; delayed type hypersensitivity response; TB33.

This invention describes a novel polypeptide (PP) of somatic proteins extract (I) which have tuberculostatic activity. (I) or their subsequence has at least one of the following properties: (a) the PP induces an in vitro recall response, or an in vitro response, during primary infection with virulent Mycobacterium, determined by a release of interferon (IFN)-gamma, (b) PP induces a protective immunity, determined by vaccinating an animal with PP and an adjuvant, three times at two weeks intervals, (c) PP induces an in vitro response, or in vitro recall response, determined by release of IFN-gamma of at least 1000 pg/ml or 500 pg/ml,

                                                                                                                                                          from TB patients, or PPD positive individuals, 6 months after diagnosis, (d) PP induces a specific antibody response in a TB patient, as determined by enzyme linked immunosorbent assay (ELISA) technique or a western blot, (e) PP induces a positive delayed type hypersensitivity (DTH) response, determined by intradermal injection. (I) and (II) are useful in preparing a prophylactic or therapeutic medicine as a vaccine for induction of a protective or generation of an immune response in a mammal against infection with a virulent Mycobacterium. (I) and (II) are also useful as diagnostic reagent for the diagnosts of a virulent Mycobacterium infection. The vaccine of the invention induces efficient immunological memory, providing long term protection against TB. This sequence represents a Microbacterium tuberculosis TB33 antigen described

-:- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
-:- SIMILARITY: BELONGS TO THE FIBRILLAR CLASS OF COLLAGENS.
-:- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Separable cis-regulatory elements that contribute site-specific alpha 2(XI) collagen gene expression

      Synthetase gene duplications.";

Proc. Natl. Acad. Sci. U.S.A. 92:2441-2445(1995)
-!- CATALYTIC ACTIVITY: ATP + L-isoleucine + tRN.
diphosphate + L-isoleucyl-tRNA(Ile).
-!- COFACTOR: Binds 1 zinc ion per subunit (By s-isoleucine) sysimilarity).
-!- SUBUNIT: Monomer (By similarity).
-!- SUBCELLULAR LOCATION: Cyroplasmic.
-!- SUMILARITY: Belongs to class-I aminoacyl-tRN
                                                                                                                                                                                      SEQUENCE FROM N.A.

ISOId=Q61188-2; Sequence=VSP_001501;
TISSUS_SPECIFICITY: WIDELY EXPRESSED IN EARLY EMBRYOS. IN LATER EMBRYOGENESIS, EXPRESSION RESURTICIED TO CENTRAL AND PERIPHERAL NERVOUS SYSTEM, LIVER AND THYMUS. IN ADULT, HIGHEST EXPRESSION IN SPLEEN, TESTIS AND PLACESVA. LOWER LEVELS IN INTESTINE AND MUSCLE AND VERY LOW LEVELS IN BRAIN AND LIVER. NO EXPRESSION IN HEART, THYROID GLAND, LUNG AND KIDNEY.
DEVELOPMENTAL STAGE: EXPRESSED IN BOTH ADULT AND EMBRYO WITH HIGHEST LEVELS IN EARLY EMBRYOGENESIS.
                                                                                                                                                                                                                                                                                                                                                                         SUBCELLULAR LOCATION: Nuclear (Probable) ALTERNATIVE PRODUCTS:

Chem. 379:45-50(1998).

FUNCTION: This protein is a subunit of the dihydropyridine (DHP) sensitive calcium channel. Plays a role in excitation-contraction coupling. The skeletal muscle DHP-sensitive Ca(2+) channel may function only as a multiple subunit complex.

SUBUNIT: The L-type calcium channel is composed of five subunits: SUBCNAL-1, alpha-2/delta, beta and gamma. SUBCELULIAR LOCATION: Integral membrane protein.

SIMILARITY: Belongs to the PMP-22 / EMP / MP20 family. CACNG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   subfamily.

New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.

Claim 4; Page 29; 37pp; English.

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HFL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region

The process is useful for identifying recombinant IBDV antibodies as immunodiagnostic or immunotherapeutic agents. (I) is useful for the diagnosis of an infection caused by at least one IBDV strain. The other methods and compositions of the present invention are useful for the prevention, diagnosis and treatment against IBDV related ailments in animals. This is the amino acid sequence of a recombinant anti-IBDV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant antibody; IBDV; infectious bursal disease virus; virucide; gene therapy; heavy chain variable region; light chain variable region; immunodiagnostic; immunotherapeutic; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant antibody fragment having a binding specificity for an infectious bursal disease virus (IBDV) antigenic determinant, useful the prevention, diagnosis and treatment of IBDV related ailments in
